

Node.js Implementation

Project File Deployment:

We connected into `excalibur.cs.mun.ca` and upload our project folder files into `.www` folder. The starting node.js file is named as 'server.js' in the root directory of the project folder. The server.js file is listening to port 3333 on the server.

Running Server file:

SSH into our project folder on my domain on `excalibur.cs.mun.ca` server using my username and password. Route to the root directory of the project folder, then use command 'node server.js' to start our node service file. While the node server file is up and running displaying 'GradRec is listening to port 3333' in the console, our GradRec create project index page should be able to visit in the browser at URL: 'sc-3.cs.mun.ca'.
